

Strong Snow Retention with Single- and Double-Tube Holder

Even with the global warming there will be snow on the roofs and the intensity will increase. When snow avalanches off of a rooftop, it can damage anything in its path! Therefore we need snow guard systems which are able to prevent even big quantities of snow on metal roofs from sliding down.

Fixed on S-5! - Mini-Clamps the RoofTech Single- and Double Tube Holder – material stainless steel - can take higher loads compared to other systems, without piercing the panels.

RoofTech Single-Tube Holder Type B

Snow retention with this Single-Tube Holder is a cost effective and visually attractive system.

The Single-Tube holder, material Stainless Steel, will be fixed on one S-5! Mini-Clamp and then common 32mm-tubes will be sliding into the tube holder.

The tube lies optimal direct on the seam and the installation is fix and easy.

RoofTech Double-Tube Holder

Snow retention with the Double-Tube Holder, material 3mm Stainless Steel, guarantees unsurpassed holding strength.

Fixed on two S-5! Mini-clamps, it is the ideal and easy connection to standing seam metal roofs.

The speciality of the Double Tube Holder is that the lower Tube is close to the seam. The top pipe is 16 - 20cm above the seam.

- **With the S-5! Clamps the stainless steel holder can be mount on all types of standing seam metal roofs and materials – also copper.**
- Fixed on the S-5! - Mini-Clamps they can take higher loads compared to other systems. This often requires less holder, clamps and rows.
- In combination with its simple and fast installation it provides a very economic and strong snow guard system.
- **Optional we offer ice-stopper, which will be fixed between the lower pipe and the roof.**

Please use our Snow Guard Calculation Service for your project.
